CONDUCTED BY

CENTER FOR RESEARCH TESTING & CONSULTANCY
DEPARTMENT OF CIVIL & ENVIRONMENTAL ENGINEERING
SHAHJALAL UNIVERSITY OF SCIENCE & TECHNOLOGY, SYLHET

SAMPLE COLLECTED BY

M/S RELATION SOIL INVESTIGATION
Kumarpara, Sylhet.
Mob : 01711063018 & 01712186249

Introduction

A reasonably accurate conception about the sub-soil parameters of any project site is an essential prerequisite for proper planning and designing the foundation of the structure so that the same after its construction would remain safe and serviceable. A detailed study on the sub-surface elements in this regard would necessary to select proper type of foundation.

Objectives

The purpose of sub-soil investigation program is to obtain the following information

1. To classify the formation of soil layers
2. To estimate the safe bearing capacities of the foundation at different soil layers
3. To suggest the safe and appropriate type of foundations.

Scope of work

Centre for research, testing and consultancy (CRTC), Department of Civil and Environmental Engineering, Shahjalal University of Science & Technology (SUST), Sylhet; execute only the laboratory tests and other computational works with the supplied disturbed and/or undisturbed samples to determine the geotechnical properties of the soil.

Table – 1: Items of the supplied samples

No	Name	Bore hole no	Depth	Quantities
01	Disturbed sample	01	0-50 ft	10
02	Disturbed sample	02	0-50 ft	10
03	Disturbed sample	03	0-50 ft	10
04	Disturbed sample	04	0-50 ft	10
05	Disturbed sample	05	0-50 ft	10
06	-	-	-	-
07	-	-	-	-
08	-	-	-	-
09	-	-	-	-
10	-	-	-	-

Laboratory Classifications

The disturbed soil samples, supplied by the client were thoroughly examined and classified roughly (color and type) and noted in accordance with bore hole (BH) and depth (Please see enclosed Tables).

Laboratory Works & Analysis

In addition to visual examination of the sample, Bearing Capacity of soil samples including skin friction & end bearing were calculated.

Bearing capacity for shallow foundation

The N value gives useful information with regards to consistency of cohesive soil and relative density of cohesion less soil. These relationships are given in the following Tables for cohesive and cohesion less soil, respectively.

Table 2: Relation of N-value with the Consistency and the Unconfined Compressive Strength of Cohesive Soils (after Bowles 1997)

N-values	Consistency	Unconfined Compressive Strength (q_u)	
		tsf	kPa
0-2	Very soft	0 to 0.25	0 to 25
3-5	Soft	0.25 to 0.50	25 to 50
6-9	Medium	0.50 to 1	50 to 100
10-16	Stiff	1 to 2	100 to 200
17-30	Very stiff	2 to 4	200 to 400
>30	Hard	>4	>400

Table 3: N and ϕ Relation to Relative Density for Fine Sand (after Bowles 1997)

N values	Compactness	Relative Density, Dr %	ϕ (degree)	Unit Weight (pcf)
1 – 2	Very Loose	0 – 15	26 – 28	70 – 100
3 – 6	Loose	15 – 35	28 – 30	90 – 115
7 – 15	Medium	35 – 65	30 – 34	110 – 130
16 – 30	Dense	65 – 85	33 – 38	110 – 140
>30	Very Dense	>85	>50	130 – 150

Table 4: N and ϕ Relation to Relative Density for Medium Sand (after Bowles 1997)

N values	Compactness	Relative Density, Dr %	ϕ (degree)	Unit Weight (pcf)
2 – 3	Very Loose	0 – 15	27 – 28	70 – 100
4 – 7	Loose	15 – 35	30 – 32	90 – 115
8 – 20	Medium	35 – 65	32 – 36	110 – 130
21 – 40	Dense	65 – 85	36 – 42	110 – 140

Table 5: N and ϕ Relation to Relative Density for Coarse Sand (after Bowles 1997)

N values	Compactness	Relative Density, Dr %	ϕ (degree)	Unit Weight (pcf)
3 – 6	Very Loose	0 – 15	28 – 30	70 – 100
5 – 9	Loose	15 – 35	30 – 34	90 – 115
10 – 25	Medium	35 – 65	33 – 40	110 – 130
26 – 40	Dense	65 – 85	40 – 50	110 – 140
>40	Very Dense	>85	>50	130 – 150

Bearing capacity for deep foundation

Foundations, preferably piles are considered to transmit heavy load from superstructure to deep and hard strata. As the formation of soil strata consists of cohesive and non-cohesive type, the evaluation criteria for the determination of skin friction and the end bearing capacities of piles also vary. Details of the evaluation are provided in the following sub-headings.

Table 6: Formula Used to Determine Bearing Capacity of Soil

Shallow Foundation	
For Cohesive Soil	
$q_a = q_u + \gamma \frac{D}{3}$ $q_a = q_u$(Common Practice)	Where, q_a=Allowable bearing capacity, q_u= Unconfined Compressive Strength, γ= Unit Weight of soil, D= Depth of footing
For Cohesion less Soil	
$q_{ult} = 30N$; $q_a = q_{ult}/FS$	q_{ult}= Ultimate bearing capacity in kPa, N = SPT Number, FS= Factor of Safety
Source: Bowles, J. E., "Physical and Geotechnical Properties of Soils", 2nd Edition	
Deep Foundation	
For Cohesive Soil	
$f_{su} = \alpha C_u$; $q_{pu} = N_c C_u$	α = Adhesion factor, f_{su} = Ultimate skin friction, C_u = Undrained Shear Strength, q_{pu} = Ultimate end bearing of pile, N_c = Bearing capacity factor for deep foundation=9
For Cohesion less Soil	
$f_{su} = N/50\ tsf$; $q_{pu} = 4N\ tsf$	f_{su} = Ultimate skin friction, q_{pu} = Ultimate end bearing of pile, N = SPT Number
Source: Rajapakse RA (2008), "Geotechnical Engineering Calculations and Rules of Thumb"	

Based on the above formula, the important parameters for foundation design have been determined and are given in **Table 7**, **Table 8, Table 9, Table 10 and Table 11** respectively.

CONCLUSION AND RECOMMENDATION

On the basis of analysis and information provided by the owner following recommendations are suggested for the proposed five storied commercial building.

***Soil profile scenario* -** Overall soil information of the investigated site is quite irregular in between the boreholes and vertical inconsistency exists in the soil formation. Two types of scenarios have been observed among the boreholes.

For borehole 01, 04 & 05 – Brown sandy clay with low bearing capacity exists up to 05 ft depth in borehole 01 and 04, and up to 15 ft depth in borehole 05 from EGL. However, a layer of brown fine sand with moderate bearing capacity has been observed at 10 ft depth in borehole 04 from EGL. After that, alternate layers of grey soft clay and grey fine sand with low to moderate bearing capacity have been noticed from 10 ft to 15 ft depth in borehole 01, 15 ft to 35 ft depth in borehole 04, and 20 ft to 35 ft depth in borehole 05 from EGL. However, grey stiff clay with low to moderate bearing capacity has been seen from 20 ft to 35 ft depth in borehole hole 01 and at 25 ft depth in borehole 04 and 05 from EGL. Then grey fine sand with good bearing capacity initiates at 40 ft depth and continues to 50 ft depth from EGL as the client provided.

For borehole 02 & 03 – Grey sandy clay with low bearing capacity has been observed up to 05 ft and 15 ft depth from EGL in borehole 02 and 03, respectively. After that, alternate layers of grey soft clay with low bearing capacity and grey fine sand with good bearing capacity have been found from 10 ft to 35 ft depth in borehole 02 and 20 ft to 35 ft depth in borehole 03 from EGL. Then grey fine sand with adequate bearing capacity initiates at 40 ft depth in both boreholes and continues to 40 ft depth from EGL as the client provided.

***Foundation options* -** In this situation, the foundation should be selected considering both the dimension and design load for the proposed building. Since soft clay soil with very low bearing capacity has been found in the top layers, shallow foundation should not be considered in this case. Deep foundation (bored/precast pile) may be selected in this case to ensure the stability of the structure. For designing any suitable deep foundation, the necessary data for skin friction and end bearing can be found from the attached **table (8 - 11)** in the report, which is based on existing soil condition.

***Safety provisions* -** It is strongly recommended to check the **settlement** of the site considering building load while designing either shallow or deep foundation. Obviously, **pile load test** covering the entire project area must be carried out for confirming the design parameters of the service pile (*if pile foundation is considered*). Moreover, the earthquake vulnerability of the project area as well as the quality management of the construction work including workmanship should be considered for the safe design of shallow or deep foundation.

***Attachments* -** The layout of the boreholes of the investigated site and the bore-log profiles with SPT values are shown in the Appendix. Client performed no special laboratory test for the proposed site.

***Special notes* -** These suggestions are tentative, and selection of type, depth, and dimensions of foundation would be decided by the Consultant or Design Engineer. It is also to be noted that the above recommendation is restricted only to the existing soil condition of **50 ft** as client provided.

RECORD OF BORING AND TESTING

CLIENT : AMZAD HUSSAIN CHOWDHURY & MD. MUTAHER HUSSIN	LOCATION: Plot #A-25, BSCIC, Khadimnagor, Sylhet.	Sandy clay with silt.
PROJECT NAME : **CONSTRUCTION OF 05 STORIED COMMERCIAL BUILDING.**	GROUND WATER LEVEL : 5'-0" BELOW EGL.	
BORE HOLE NO. **03**		Clay with silt & sand.
METHOD OF BORING : **WASH.**	STARTING DATE : 18/08/2022	
BORING DIA : **0.33 ft**		Sand with silt & clay.
DEPTH OF BORING : 50 ft	COMPLETION DATE : 19/08/2022	
		Organic/coarse sand
